this is even cooler yet. we are embarking on dabbling in genetic algorithms. we currently are developing an application that does its job without genetics and it does an ok job but with GA's can be some much more. the only problem is that the application does not use a database connection which might turn out to be a hog of a performer and never come back with a good solution on a personal computer. we have to do some proof of concepts and see what happens. check back later to see what happens!
